Abitibi Metals Corp. (AMQ: CSE)

The 150m step-out extends B-26 Western Copper-Gold Zone with 8.16% CuEq over 3.2m within 11m @ 3.93% CuEq, highlighting significant expansion potential

On October 30, 2025, Abitibi Metals announced new assay results from its ongoing Phase 3 drill program at the B-26 Polymetallic Deposit in Québec. Abitibi Metals currently owns 50% of B-26 and retains the option to earn an additional 30% from SOQUEM Inc. Recall on October 17, 2025, Abitibi Metals had provided visual observations of drill hole 1274-25-373-W1 with ~10% chalcopyrite stringers and semi-massive mineralization within an intersected interval of 7.3 m (from 1,285.0 to 1,292.3 metres depth) in strongly chloritized felsic pyroclastic sequence (see: https://www.linkedin.com/posts/eric-lemieux-9468715_quebec-abitibi-selbaie-activity-7386910206644916225-9WiQ?utm_source=share&utm_medium=member_desktop&rcm=ACoAAAEEcwYBYv9lQ3WrNxLu2lPkWSB479Ajztl).

Confirmation of significant intercept - Western Plunge Copper-Gold Zone: Hole 1274-25-373W1 assayed **3.2m @ 8.16% CuEq (6.26% Cu, 2.21 g/t Au)** within 11m @ 3.93% CuEq (2.92% Cu, 1.17 g/t Au). This assay result confirms a significantly expanded high-grade Western Copper-Gold Zone, with strong continuity and a meaningful increase in potential resource footprint. The 150-m step-out intersected some of the best grades returned to date on the B-26 Project. The drill plan has been revised to follow up in this highly prospective area. To further delineate this zone, at least 5 additional holes are currently being drilled as part of the ongoing expansion program. Hole 1274-25-373, collared ~80 m east of 373W1, intersected 4.5 m grading 2.10% CuEq (1.53% Cu, 0.66 g/t Au) within a broader 11-m interval grading 1.22% CuEq. These results build on previously reported intercepts from holes 1274-25-269W1B and 1274-25-269W2B to the east, which together outline a robust and expanding mineralized corridor.

Discovery of a New Copper-Gold Zone to the West: Hole 1274-25-372, drilled ~300m west of the current block model limit, intersected 25m of copper mineralization at a vertical depth ~500 m. The interval is said to display dark chlorite alteration and chalcopyrite stringers and disseminations, typical of the main volcanogenic copper-gold system. Within this zone, a notable intercept of 0.91% Cu and 0.89 g/t Au (1.7% CuEq) over 3m was obtained — the best result to date in this far-west area of the B-26 Polymetallic Deposit. This discovery may represent the emergence of a new copper-gold shoot, opening up another growth opportunity for the B-26 Project. Follow-up drilling is planned as part of the upcoming winter regional program to further test and expand this highly promising area.

Expansion of Zinc-Silver VMS Zone: Additional holes, 1274-25-371 and 1274-25-371W1, also delivered strong results, confirming the down-plunge extension of the zinc-silver VMS zone to depths of up to 225 m. Hole 1274-25-371W1, starting at 866.5 m downhole, intersected 7.2 m grading 2.29% CuEq (3.56% Zn, 166.81 g/t Ag) within a broader 24-metre interval grading 1.05% CuEq, confirming the strong continuity of mineralization at depth. Hole 1274-25-371 returned 5.55 m grading 1.36% CuEq (1.29% Cu, 2.38 g/t Ag) within a 200-metre mineralized corridor, extending the lens by ~225 metres along strike. These results reinforce the growth potential of the zinc-silver zone, which remains open both along strike and at depth. The wide spacing of historical drilling in this area highlights the significant potential for further expansion and definition of the zinc-silver mineralization. Additional follow-up drilling is planned after further downhole televiewer and geophysical investigations to refine targeting and better delineate the extent of this expanding mineralized lens.

New results continue to demonstrate growing expansion potential at B-26, which remains open at depth and along strike. The results from all these holes further validate the continuity of mineralization at depth along the down plunge of the western Cu-Au mineralized shoot and the down-plunge extension of the zinc-silver VMS zone within the current resource model of 11.3Mt @ 2.13% Cu Eq (Indicated) (1.23% Cu, 1.27% Zn, 0.46 g/t Au and 31.9 g/t Ag) and 7.2Mt @ 2.21% Cu Eq (Inf.) (1.56% Cu, 0.17% Zn, 0.87 g/t Au and 7.4 g/t Ag). The B-26 Project is located ~5 km SE of the past-producing Selbaie Mine and on-going results shall positively contribute to the expansion of its mineral resource base. Please see site visit report: https://www.linkedin.com/pulse/abitibi-metals-corp-amq-cse-amex-exploration-inc-amx-v-eric-lemieux-0umve/?trackingId=CO%2BjfctESXOwjNnEs5MIRQ%3D%3D.

Following the match plan: To date, 16,990 m of the 20,000-m Phase 3 program at B-26 has been completed, with remaining drilling scheduled for completion by the end of November. The Phase 3 is a fully funded drilling program designed around these 3 strategic objectives:

i) Expansion of High-Grade: Drilling continues to expand higher-grade zones at B-26, driving resource growth in the block model. The latest results, led by standout hole 1274-17-269W3 (4.46% CuEq over 21.1 m), reaffirm the strong momentum of the program and underscore the exceptional strength of the B-26 mineralization.
ii) Expansion of Mineralized Trends: Extending open-ended mineralized trends beyond the current B-26 in various directions of the block model is one of the primary goals.
iii) Unlocking Regional Potential: making new discoveries across Abitibi's 3,328-ha property is set to become the next focus in Q1 2026 and set B-26 Polymetallic Deposit as anchor to a district scale play.

Jonathon Deluce, CEO of Abitibi Metals commented: "*These latest results mark a very significant milestone for Abitibi Metals. The 150-metre step-out confirms that B26 has the grade, scale, and continuity to become a cornerstone copper-gold asset in Québec. We're now seeing consistent growth across multiple zones, from high-*

grade extensions in the west to expanding zinc-silver horizons at depth, all pointing to a much larger system than previously defined. With strong momentum, further assays expected, and a fully funded path through 2027, we're positioned to continue to showcase why B26 is one of Canada's next standout critical-minerals projects".

Louis Gariépy, P.Geo., Vice President Exploration of Abitibi Metals, stated: *"Geologically, these results reinforce our understanding that B26 hosts a robust, multi-phase mineralized system. The 150-metre step-out confirms that the Western Copper-Gold Zone maintains strong grades at depth and along plunge, while new drilling into the VMS horizon continues to extend zinc-silver mineralization well beyond the existing resource model. The discovery of copper-gold mineralization 300 metres west of the block model, within the same alteration signature as the main deposit, suggests the system remains open laterally to the west and at depth. Every metre drilled is adding confidence and scale to what is shaping up to be a large mineralized footprint".*
