Abcourt Mines Inc. (ABI-V)

Abcourt intersects 3.7 g/t Au over 11 m directly below the Cartwright stripping and publishes a summary of the 2025 drilling campaign on its Flordin Property in the Lebel-Sur-Quévillon area, Abitibi, Québec

On May 12, 2025, Abcourt reported the latest assay results from its 2025 drilling campaign on its Flordin Property. The 100% owned Flordin Property is located in the Lebel-sur-Quévillon area of the Québec, in the heart of the Abitibi. Hole FL-25-284 intersected 3.7 g/t Au over 11 m (including 11.0 g/t Au over 2.4 m). This high-grade gold mineralized zone was intercepted <3 metres from surface directly below the Cartwright stripping in the eastern end (see: https://www.linkedin.com/pulse/abcourt-mines-inc-abi-v-prepares-new-stripping-drilling-eric-lemieux-psvde/?trackingId=JP8Gqh8JTfKJM1dIejDWUQ%3D%3D).

The objectives of the 2025 drilling campaign on the Flordin Property were:
i) Confirm the continuity of gold mineralization directly below the Cartwright stripping completed in the fall of 2024. A total 9 short holes for a total of 1,227 m were drilled in the Cartwright area. All the 2025 drillings carried out under stripping returned gold values over tens of metres in length. Hole FL-25-274 returned 3.5 g/t Au over 27.5 m (including 12.1 g/t Au over 7.5 m), making this intersection one of the richest in gold in the project. Note that the easternmost

hole of the stripping, DDH FL-25-277 intersected 1.4 g/t Au over 13 m, and confirms that the Adam and Horse mineralized zones continue eastwards and remain open. As for the westernmost hole, DDH FL-25-286 intersected 0.4 g/t Au over 16 m, and confirms that the mineralization is continuous and open, in part, to the west. We determine an average grade x thickness of 17.02g/t Au x m for the intersections on the Cartwright Zone over a ~250 ESE-WNW strike at an average ~50m depth.
The mineralization described in the Cartwright area consists mainly of gold-bearing pyrite band with silica-hematite without quartz vein. This type of characteristic high-grade gold mineralization has also been described in the central area of the property (by 2023 drilling) and in the South Zone area, which is located ~1.8 km from the Cartwright Zone.

ii) Confirm the presence and continuity of the South Zone that was discovered in 1988 by Cambior and compare the mineralization of the South Zone to the Cartwright area. In all, 4 deep holes for a total of 2,403 m were completed. All 2025 drilling in this area returned gold values over tens of metres in length. Hole FL-25-282 returned 1.1 g/t Au over 47.2 m (including 7.6 g/t Au over 3 m). We estimate an average grade x thickness of 16.04g/t Au x m for the 12 intersections on the South Zone. The panel intercepted is at ~420m depth along drill home and covers a ~200 E-W strike.
The mineralization of the South Zone is like that described in the Cartwright area. In general, silicification seems to be more important for the South Zone. However, we understand it is noted that both zones are characterized by high-grade gold mineralization associated with bands of pyrite, silica, and pink hematite as well as some magnetite and sericite. The gold mineralization is not associated with quartz veins but rather with pyrite-silica-hematite bands.

Next steps: A comparative petrographic study is being conducted by Ms. Lucie Mathieu, Ph.D. of GEOX Consulting Inc. (https://consultationgeox.squarespace.com/home-1) to describe the similarities and differences observed in the gold mineralization for the 3 sectors (Cartwright, Central Zone and South Zone). A geochemical study of the major elements is also being carried out, which shall make it possible to identify the lithologies and alterations present in the various mineralized areas of the property. We would expect further drilling later in 2025.

Pascal Hamelin, President et CEO commented: "*The 2025 drilling campaign carried out on our Flordin project was a great success. All the drill holes drilled by our technical team returned gold values over tens of meters of thickness. This first phase of work will have identified a characteristic type of high-grade gold mineralization over a distance of at least 2 kilometres. The second phase of drilling will aim to link the various mineralized zones laterally. The Flordin project is advantageously located less than 20 kilometres North of the municipality of Lebel-Sur-Quévillon and less than 1.5 kilometres North of the Canadian National Transcontinental Railway*".
