Brunswick Exploration Inc. (BRW-V)

Brunswick drills up to 1.14% Li₂O over 37 meters at the Mirage Project extending the MR-3 and MR-6 dyke systems.

Brunswick on January 9, 2025 announced the final results from the Mirage summer drilling campaign. This campaign focused on the Central Zone including the MR-6 and MR-3 dykes and has continued to intersect wide and well-mineralized intervals on their extension and at depth. Recall on October 8, 2024, Brunswick had reported the first set of drill results from the Mirage summer drilling program (https://www.linkedin.com/posts/eric-lemieux-9468715_quebec-jamesbay-mirage-activity-7249509654970396672-nxpU?utm_source=share&utm_medium=member_desktop) following the commencement of a 5,000-metre summer drill program at Mirage in July 2024 (see: <https://www.linkedin.com/pulse/brunswick-exploration-inc-brw-v-outlines-new-rich-boulder-lemieux-nljme/>). The Mirage Project is located in the Eeyou Istchee-James Bay region of Québec, ~40 km south of the Trans-Taiga Road and is composed of ~427 claims located ~34km NE of Winsome Resources Adina Project which could eventually be tied to the Renard Project at the head of Route 167 Ext.

Salient intercepts from the Central Zone include:

37 m @ 1.14% Li₂O in hole MR-24-87 and 1.15% Li₂O over 23 m in hole MR-24-89 extending mineralization at the MR-3 Dyke down dip where it remains open.

19.7 m @ 1.74% Li₂O in hole MR-24-84 and 0.93% Li₂O over 13.5 m in hole MR-24-75 extending the MR-6 Dyke to the NW.

12.9 m @ 1.39% Li₂O and 1.99% Li₂O over 10 m in hole MR-24-78, 1.32% Li₂O over 16.1 m in hole MR-24-80 and 1.61% Li₂O over 9.9 m in hole MR-24-85; confirming multiple new intervals in the stacked dyke area east of MR-6 Dyke.

The summer 2024 drilling campaign focused on extending the mineralized dykes identified during the last 2 previous drilling campaigns. Brunswick has drilled ~12,000m to discover, delineate and expand the spodumene bearing pegmatites dykes at Mirage.

Potentially thickening at depth on MR-3: The holes MR-24-86, MR-24-87 and MR-24-89 extended the MR-3 Dyke 150m to the South. MR-3 has been now drill traced over an area measuring over 250 m x 250 m with an average thickness of 25 m. Identified at surface to the north, the dyke plunges to the South where it remains open with the last intercept at a depth of only 125 m vertical. Interestingly, hole MR-24-87 shows a significant thickening of the pegmatite where it reaches an overall size of 58 m downhole. This is associated with a larger core of higher-grade lithium mineralization highlighted in the intercept of 37m @ 1.14% Li₂O.

Expanding MR-6 Dyke swarm system: Holes MR-24-75 and MR-24-84 expanded the MR-6 Dyke 100 m to the SW. MR-6 has been now drill traced over an area measuring over 350 m x 350 m with an average thickness of 30 m with a core zone where the average thickness increases to 50 m. MR-6 continues to be open to the NW from surfaces to 170 m vertical.

Holes MR-24-78, MR-24-81 and MR-24-85 were drilled in the stacked dyke zone located immediately to the East of MR-6. These new holes continue to confirm the potential of this zone with multiple wide high-grade lithium mineralization. Contained within an envelope of 250 m x 300 m, this zone remains open to the North, East and South. More drilling is required to improve the interpretation of the geometry of each dyke swarm in this zone.

Hole MR-24-91, drilled for forthcoming metallurgical results, reaffirms the thick, near-surface continuous mineralization at MR-6 Dyke with 56 m @ 1.40% Li₂O. Holes MR-24-90, 92 and 93 confirm some continuity on the MR-4 Dyke. We estimate for the final 16 drill holes disclosed a grade x thickness metric of 10.77% Li₂O x m. Overall, we estimate and grade x thickness metric of 12.69 % Li₂O x m for the summer 2024 drilling campaign.

Mr. Killian Charles, President and CEO of Brunswick, stated: *“Once more, our drilling continues to expand the known mineralized zones at Mirage both along strike and down-dip. I’m particularly pleased to see the wide, well-mineralized intercept in MR-3 where the dyke appears to thicken at depth. This is something observed across many well-mineralized lithium systems globally and Mirage is no different. Our primary objective at Mirage and across our portfolio is focused on defining a resource of at least 50Mt within 50km from infrastructure and drilling to date continues to underscore this potential. While 2024 has been a challenging year for lithium markets, we have kept our focus on expanding Mirage and outlining new targets across our portfolio. We drilled approximately 12,000 meters just at Mirage, outlined several new significant dykes and substantially expanded the near-surface MR-6 dyke. Outside of Mirage, we also made the first greenfield lithium discovery in Greenland. As we look to 2025, we will build upon these successes with a major winter drill program at Mirage, which will target new zones that have never been drilled before and launch one of the largest grassroots exploration program ever in Greenland”.*
