VIOR INC. (VIO-V)

Vior reports new high-grade discovery at Lac Guillet area, Belleterre Gold Project, Abitibi-Témiscamingue, Québec.

On July 9, 2025, Vior reported that a significant new high-grade gold discovery has been made south of the past-producing Belleterre Gold Mine at its flagship Belleterre Project in the Abitibi-Témiscamingue region of Québec. The newly received drill results indicate a new mineralized high grade gold intercept of 97.9 g/t Au over 1.5 m in the Lac Guillet area to the SSW of Belleterre Gold Mine and a new mineralized zone at depth in the Hoskin Zone located north of the former Belleterre Gold Mine. Recall on May 15, 2025, Vior had provided updates on its exploration activities at Belleterre with drill results from the +60,000-metre drill program of up to 4.76 g/t Au over 2.6 m (including 21.9 g/t Au over 0.5 m) intersected below the past producing Belleterre Mine. We had stated that though underwhelming, all drill holes completed were helping advance the knowledge of the Belleterre area gold systems and that Vior was prioritizing the drilling program for gold mineralization associated with major ductile deformation zones such as the Lac Guillet shear zones, a substantial deformation corridor extending for over ~3km, SSE of the Belleterre Mine corridor (Lac Guillet Deformation Zone).

Potentially significant new high-grade gold discovery: On the Lac Guillet Deformation Zone, drillhole BV25-141, intersected: 97.9 g/t Au over 1.5 m (at ~100 m vertical depth). This interval is located on strike with the QFP-A surface gold showing, ~100 m to the east, originally identified by Vior in 2022. The intercept is located ~2 km SSW of the former Belleterre Gold Mine with mineralization hosted in brecciated volcanic rocks accompanied by trace to 0.5% pyrite and pyrrhotite and moderate silicification alteration. The result highlights the gold-bearing potential on the north margin of the Lac Guillet corridor, a 250-metre-wide ductile deformation zone with limited historic drilling. Follow-up work is planned to investigate for lateral and vertical continuity of this zone.

New Gold Zone Discovered at Hoskin: Drillhole BV25-143, targeting the Hoskin Zone, intersected a previously untested gold-bearing interval at ~400 m vertical depth, returning up to 3 g/t Au over 4.3 m, (including 10.6 g/t Au over 1 m). This mineralization is hosted in Smokey Grey quartz veins within a biotite-altered mafic volcanic unit, with trace to 3% blebby pyrite and clusters of chalcopyrite and sphalerite. This zone remains open in all directions and demonstrates the potential for depth extension within the Hoskin structural corridor.

Setting stage for more discoveries: The new zones are located within a NE striking deformation structure, reinforcing the importance of structural control in the development of high-grade gold systems at Belleterre. These extensive ductile deformation zones are being recognized and tested. Previous compartmentalized claim ownership with boundaries made exploration more challenging. Vior is well positioned to unlock the potential value of several promising regional gold showings (see: https://www.linkedin.com/pulse/vior-inc-vio-v-viors-year-review-2022-plans-advance-eric-lemieux/).

Next steps - Advancing toward phase 2 drill program: With the completion of this first phase of drilling anticipated in the coming weeks, Vior has now drilled over 69,000 m across the Belleterre district since 2021. Vior is preparing to commence its second phase of drilling, which shall prioritize follow-up at both Lac Guillet and Hoskin, in addition to testing several other high-potential regional and brownfield targets. In the past few weeks, Vior received several drill permit authorizations and plans to ramp up its drilling activities back to 4 rigs by the beginning of August.

Mathieu Savard, President and CEO of Vior stated: "*These high-grade results arrive just in time as we're expecting to start our second phase of drilling in the coming weeks. This new discovery at the Lac Guillet shear zone confirms the merits of this high potential area where close to 20,000 meters of systematic drilling is planned during the second half of the year*".
