VIOR INC. (VIO-V)

Vior provides exploration update at Belleterre and Ligneris, Abitibi-Témiscamingue, Québec.

On October 15, 2025, Vior announced results from its 100,000-m drill campaign on its flagship Belleterre Gold Project in the Abitibi-Témiscamingue region of Québec. Vior also provided an update on the upcoming drilling campaign on its Ligneris Project in the heart of the Abitibi. Ligneris is located 70 km East of Normétal, Québec and Amex Exploration (AMX-V) Perron Project (see: https://www.linkedin.com/pulse/amex-exploration-inc-amx-v-abitibi-metals-corp-amq-cse-eric-lemieux-yrtbe/?trackingId=dh5IPtZOSHaD979VeqxlVQ%3D%3D).

Belleterre – just smoke so far: The newly received results include gold intercepts in the former Belleterre Mine Trend that returned up to 5.34 g/t Au over 2m in Conway Zone, 1.98 g/t Au over 7.35m and 1.33 g/t Au over 3m at Aubelle Zone and 4.56 g/t over 1.7 m at Hoskin. We estimate for the 4 disclosed holes an average grade x thickness metric of 9.24 g/t Au x m. We have stated previously that drill results have been rather underwhelming for the moment. We still however have good anticipations for the upcoming regional exploration.

Drillhole BV25-169, targeting the Conway Zone, intersected 5.34 g/t Au over 2m at ~375 metres vertical depth of the Conway Zone and confirms a potential extension at depth. The mineralization is hosted within a biotite-altered and sheared mafic volcanic unit, which contains up to 5% smoky grey quartz veins.

Drillholes BV25-168 and BV25-170, targeting the Aubelle Zone, intersected respectively 1.33 g/t Au over 3m and 1.98 g/t Au over 7.35m at 720 metres and 450 metres of vertical depth. These 2 intervals are in the vertical extension of the Aubelle Zone. The mineralization, containing up to 5% clustered and disseminated pyrite and pyrrhotite with trace of clustered sphalerite and chalcopyrite, is associated with quartz veins hosted within a biotite-altered and sheared mafic volcanic unit.

New gold zone confirmed at Hoskin: Drillhole BV25-161, which followed up on drillhole BV25-143 that returned 3 g/t Au over 4.3m at ~400 m vertical depth at Hoskin (see: https://www.linkedin.com/posts/eric-lemieux-9468715_quebec-temiscamingue-belleterre-activity-7349446446003195904-veiX?utm_source=share&utm_medium=member_desktop&rcm=ACoAAAEEcwYBYv9IQ3WrNxLu2lPkWSB479Ajztl), successfully intersected mineralization at ~485 metres vertical depth, returning 4.56 g/t over 1.7m. The mineralization is hosted in a quartz vein at the contact between a gabbro and a mafic volcanic unit. Both rocks are biotite-altered near the vein and contain trace to 2% clustered and disseminated pyrite. This zone remains open the western end and at depth and demonstrates the potential for extension within the Hoskin structural corridor.

Lac Guillet Deformation Zone: Drilling in the Lac Guillet Deformation Zone, 2 km south of the former Belleterre Mine Trend, is said to be advancing well while several analytical results are still pending representing ~25 drillholes. Recall on July 9, 2025, Vior had disclosed a significant new high-grade gold discovery south of the past-producing Belleterre Gold Mine. The drill results indicated a new mineralized high grade gold intercept of 97.9 g/t Au over 1.5 m in the Lac Guillet area to the SSW of Belleterre Gold Mine.

Mathieu Savard, President and CEO of Vior, commented: "*We have completed most of the drilling in the Belleterre Mine Trend and are waiting for the drilling results from the Lac Guillet Deformation Zone to the south where approximately 25 drillholes are pending assay results. Drilling will continue until the end of the year to complete the Guillet Deformation Zone program while also testing regional targets at Belleterre*".

Upcoming Exploration Activities on Ligneris Project: Vior is preparing to initiate a 20,000 m drilling program on its 100% owned Ligneris Project composed of 142 claims for 7,273 ha. Vior has recently expanded its Ligneris Project by acquiring 213 additional claims through map designation.

The program shall commence upon receipt of all required authorizations and permits that were submitted in the previous weeks. The first phase of the drilling campaign shall focus on the 3 main mineralization zones: North Zone, Central Zone and South Zone. Historical intercepts of 537.91 g/t Au over 1.8m (DDH 275-037) and 70 g/t Au over 0.6m (DDH 275-27B) have been obtained in the North Zone, while values of 0.91 g/t Au over 24m (including 5.72 g/t Au over 3.1m) in DDH 275-053 and 4.92 g/t Au over 5.4 m (DDH L-84-4) were obtained from Central Zone, whereas 5.15 g/t Au over 5.9m (DDH LS-05) and 16.84 g/t Au over 8m (including 39.15 g/t Au over 3m) (DDH 275-073 have been obtained in the South Zone.

These zones are included within the felsic volcanic belt of the Rivière Octave and are affected by NE-SW shear zones of the Laflamme corridor. The abundance of polymetallic sulphides, along with strong sericite, chlorite and chloritoid alterations within the bimodal volcanic context, overlain by gold enrichment associated with intense carbonatation and a steeply dipping, ductile and anastomosing fault corridor, supports the interpretation that mineralization at Ligneris represents a hybrid system between Gold-bearing VMS and Orogenic Gold deposit. The known mineralized zones remain underexplored both at depth and laterally along strike.

In addition, Vior has planned this fall a high-resolution magnetic helicopter-borne survey, including VLF-EM measurements is for the northern portion of the Ligneris Project. This geophysical work shall provide a complete and high-quality geophysical coverage across the entire project area, enhancing the geological understanding and supporting future targeting.

Mathieu Savard, President and CEO of Vior, added: " *"We are quite excited about the upcoming drill program at Ligneris expected to start sometime in November following the receipt of the necessary permits. The Ligneris project exhibits both Gold-bearing VMS and orogenic gold deposit mineralization style and the program will aim at testing both. The program will test vertical and lateral high-grade gold and large lower grade gold intervals that were obtained historically. In addition, we will drill several regional targets in the belt that were not previously tested*".
