1911 Gold Corporation (AUMB-V):

1911 Gold reports additional results from underground delineation drilling at the True North Gold Project, Manitoba.

On April 2, 2026, 1911 Gold provided additional assay results from the underground drill program at it's 100%-owned operational and fully permitted True North Gold Project, Manitoba, Canada. These assay results represent 10 drill holes for 1,464 m from the underground delineation drill program on the mineral resources outlined within the mine plan in the recent PEA. Recall on February 10, 2026, 1911 Gold had reported positive results from the independent PEA (Preliminary Economic Assessment) for the True North Gold Project and on March 27, 2026, had filed the supporting Technical Report by prepared by AMC Mining Consultants (Canada) Ltd. (see: https://www.linkedin.com/pulse/1911-gold-corporation-aumb-v-delivers-positive-pea-true-eric-lemieux-bg3xe/). The fully permitted 100%-wholly owned True North Gold Project is located within the 100%-owned Rice Lake Gold property, southeast Manitoba and within the First Nation communities of the Hollow Water First Nation and the Black River First Nation. The underground infill and delineation drill program has focused on 2 areas scheduled for early production in the PEA mine plan that are readily accessible from the existing Level 16 development. Current development drilling continues to focus on upgrading and delineating the resources for the initial years of the mine schedule and supporting an upcoming bulk sampling and test mining production.

Defining the Hinge Zone: Drilling results complete the Hinge Zone delineation drill program (31 drill holes completed for a total of 4,608 m) and confirmed continuity of gold mineralization within the Hinge Zone V-810 vein as outlined in the PEA mine plan for the early years of mining, located adjacent to Level 16 (695 m below surface). Salient results from the 10 holes include:
9.51 g/t Au over 3.5 m at 133.8 m downhole depth, (including 12.70 g/t Au over 0.7 m, and 30.7 g/t Au over 0.6 m) in DDH UG16-26-038;
12 g/t Au over 1 m at 128.8 m downhole depth and 7.44 g/t Au over 0.50 m at 132 m downhole depth in DDH UG16-26-046;

6.71 g/t Au over 2 m at 117 m downhole depth, (including 11.4 g/t Au over 0.8 m) in DDH UG16-26-041;
5.78 g/t Au over 1.1 m at 118m downhole depth, (including 6.46 g/t Au over 0.5 m) in DDH UG16-26-042; and
4.1 g/t Au over 1.4 m at 112.9 m downhole depth, (including 5.59 g/t Au over 0.7 m) in DDH UG16-26-043.

8 of 10 drill holes completed intercepted the vein and we estimate an average grade x thickness metric for all 31 drill holes of 10.34 g/t Au x m.

The drill holes were planned to intersect the modelled vein on a nominal 15 m spacing to upgrade indicated resources to the measured resource category. The V-810 vein modelled in this zone has an average width of 1.2 m, diluted to 1.5 m minimum width in the PEA mine plan. The V-810 vein is hosted by a dacitic lapilli tuff unit, characterized by NW trending shear and extensional stockwork style veins and vein breccias subparallel to the stratigraphy. The mineralized footprint is modelled as ~120 m long and ~100 m wide zone plunging N13E/52° at the intersection of dacitic lapilli tuffs unit and the regional mineralized Hinge shear zone. Data interpretation defines a classic "pinch-and-swell" geometry of shear hosted veins both on strike and vertically with a consistent core of higher-grade gold mineralization ~40 m wide extending ~100 m down plunge. Mineralized veins are composed of white quartz with thin bands of tourmaline- sericite-pyrite and chlorite as well as albite and iron-carbonate. Additional drilling is planned to test the extension of the V-810 vein at Hinge between the current resource and Level 16, located 25m down plunge.

Opportunities abound: The results from the delineation drilling on Hinge V-810 shall be incorporated into the project database to improve the vein wireframe modelling and to update the resources and stope designs to support an optimized mine plan. We understand a number of drill holes also intercepted mineralization outside of the currently modelled veins (not included in the PEA mine plan) and suggests a potential vein system parallel to the Hinge vein V-810, and outside of the modeled wireframes.
Beyond the immediate mine plan, 1911 Gold has also been investigating new target areas within the True North Mine Complex footprint. This includes underground drilling on the Shore Target and the San Antonio Southeast ("SAM SE") depth extensions, as well as testing the extensions of mineral resources included in the PEA mine plan. Drilling is progressing on all targets, and additional results should be released in due time.

Shaun Heinrichs, President and CEO commented: "*Drilling has confirmed mineralization within the targeted V-810 vein within Hinge, an area that will be considered for test mining activities later in the year. These additional results are in line with previous delineation drilling at Hinge with a consistent core of higher-grade gold mineralization approximately 40 m wide extending approximately 100 m down plunge. The ongoing drill program is focussed on infill and delineation drilling in areas that are included in the first years of mining within the PEA mine, as well as exploration and resource expansion drilling. We currently have two drills on surface and* *plan to mobilize a third underground drill rig over the next month which will continue to provide infill and resource expansion results as we expand our resource base in 2026 and advance towards the planned mine restart in 2027*".
