Abcourt Mines Inc. (ABI-V)

Abcourt intersects 0.5 g/t Au over 153 m including 10.9 g/t au over 2.1 m in drilling on the Flordin Property

On July 8, 2026, Abcourt announced that it has completed all drilling under the Cartwright stripping and in the extension of stripping 25-02, located 300 m west of the Cartwright stripping, on the Flordin Property. The 100% owned Flordin Property is located in the Lebel-sur-Quévillon area of the Québec adjacent to the west of the Kinebik property now owned by Vior Gold Corporation (see: https://www.linkedin.com/pulse/vior-gold-corporation-inc-vio-v-announces-major-abitibi-eric-lemieux-dhkse/?trackingId=LId7%2BkpMQ6Go1bOHzKC1Wg%3D%3D). Recall on April 27, 2026, Abcourt had disclosed that it had completed a drilling program (11 drill holes for 2,960 m) drilled on 2 NW-SE lines east of the Cartwright stripping to the boundary of its Flordin Property.

Continuing to drill: The 2026 drilling campaign should total ~20,000 m. In total, 8 holes for a total of 2,330 m were carried out in the 2 sectors, 4 holes under the Cartwright stripping and 4 in the 25-02 sector.
The 4 new holes drilled below the Cartwright stripping confirmed the continuity of the structure and gold mineralized zones at depth ~200 m. Hole FL-26-298 intersected a mineralized envelope of 0.3 g/t Au over 29.5 m (including 3.9 g/t Au over 1 m). Only 3 historical holes have been drilled at more than 250 m in this area. With very little information regarding the presence of mineralization between 200-250 m below surface levels, Abcourt has mandated Abitibi Géophysique to conduct an IP survey. The purpose of this geophysical survey is

to detect anomalies that may contain gold mineralization at depth below the Cartwright Trench. The IP No. 3 anomaly was partially drilled during the winter (FL-26-300) and grades of 0.3 g/t Au over 22.5 m (including 2.3 g/t Au over 1 m) were intersected. The anomalies detected during the geophysical survey shall be ranked and followed by drilling during the next phase of work of 10,000 m upon receipt of all necessary permits.

The other 4 holes drilled in the area of stripping 25-2 extended the gold-bearing structure more than 300 m west of the Cartwright Trench. Gold grades in this area are more modest but confirm the importance of the lateral extension of the mineralized system, with the continuity of gold mineralization confirmed by drilling from the Cartwright Trench to stripping 25-2. The integration of the new data from the 2026 holes into the computer geological model has so far made it possible to validate the interconnection of the mineralized zones with each other over more than 2 km (historical and new).

The drill rig was then moved to the South Zone area to investigate its potential at an average depth of 200 m. Last year, the 4 holes drilled in the eastern extension of this zone intercepted gold mineralization at ~400-500 metres depth. The first hole, FL-26-306, of the 2026 campaign completed in this area visually contained tens of metres of pyrite mineralization with the typical alterations associated with the presence of gold. Assay results for this first hole in the South Zone of the 2026 campaign confirmed the presence of gold with a grade of 0.5 g/t Au over 153 m (including 10.9 g/t Au over 2.1 m). A mineralized envelope of such magnitude in an area that has been virtually unexplored to date could significantly increases the value of the Flordin Project and its South Zone. Several exploration holes drilled in this area are currently being assayed. These exploration holes, which are spaced ~50-75 m apart, have all visually intersected mineralized envelopes typical of the South Zone. The gold endowment of the South Zone is potentially of significant interest – *à suivre*…

Pascal Hamelin, President and CEO commented: "*The first phase of our ambitious 20,000-metre drilling program is nearing completion. We will reach 10,000 metres drilled by the end of July without any accidents or incidents of any kind. The results*

announced to date confirm the relevance of continuing exploration work on our Flordin project. We have only just started drilling in the South Zone area and are already observing mineralized intervals over 100 metres thick. It is this type of major gold intersection that confirms that our Flordin project is a strategic asset of the utmost importance in our portfolio of properties".
