Brunswick Exploration Inc. (BRW-V)

Brunswick continues to extend MR-6 and discovers new spodumene bearing dykes at Mirage Project, Eeyou Istchee-James Bay, Québec.

On October 8, 2024, Brunswick reported the first set of drill results from the Mirage summer drilling program. The Mirage Project is situated in the Eeyou Istchee-James Bay region of Québec, ~40 km south of the Trans-Taiga Road. The Mirage Project is composed of ~427 claims located ~34km NE of Winsome Resources Adina Project which could eventually be tied to the Renard Project at the head of Route 167 Ext. This drilling program concluded with a total of 23 drill holes for 4,871m. Recall on July 23, 2024, Brunswick had announced the completion of the 2024 prospecting program and the commencement of a 5,000-metre summer drill program at Mirage Project (see: https://www.linkedin.com/pulse/brunswick-exploration-inc-brw-v-outlines-new-rich-boulder-lemieux-nljme/). Since the beginning of 2024, Brunswick has drilled ~12,000m to discover, delineate and expand the spodumene bearing pegmatites dykes at Mirage.

Continuing to intersect wide and well mineralized intervals on their extension and at depth: The summer drilling campaign focused on extending the mineralized dykes recognized during the last 2 drilling campaigns on the Central Zone, including the MR-6 and MR-3 dykes. Several new lithium pegmatites were intercepted immediately surrounding MR-6 dyke located in the Central Zone. Holes

MR-24-72, Mr-24-73 and MR-24-74 extended the MR-6 dyke over 100m to the West and to the South with multiple significant, near-surface intervals; notably 1.75% Li2O over 40.4m in drill hole MR-24-73, 1.07% Li2O over 24m in drill hole MR-24-74 and 1.25% Li2O over 16m in drill hole MR-24-72. MR-6 has now been now drill traced over an area measuring 250m x 250m with an average thickness of ~60m and dip towards the NW. MR-6 remains open to the West and to the North.

Up to 3 new stacked dykes confirmed located 250m to the East of MR-6 with 1.25% Li2O over 26m, 1.49% Li2O over 26.2m and 1.93% Li2O over 22.35m all in drill hole MR-24-76. Hole MR-24-76 expanded mineralized dykes identified in previous hole MR-24-60 by intersecting similar wide high-grade mineralization with inferred dip to the SE. It is believed these stacked dykes are likely not related to MR-6 even if they occur in proximity. These stacked dykes dip to the SE and remain open to the North, South and East.

Brunswick Exploration shall also commence metallurgical studies in the coming weeks for the MR-6, MR-4 and MR-3 dykes.

Mr. Killian Charles, President and CEO of Brunswick, stated: "*Once again, our drilling underscores the significant potential of the Mirage project. We continue to rapidly identify and expand multiple pegmatite dykes in the core of the project in the Central Zone. These dykes still remain open in multiple directions with continued evidence of near-surface dyke staking. As we continue to delineate these targets, we have begun preparation for metallurgical studies which we believe will highlight the typically coarse mineralization observed at Mirage. With more exciting results forthcoming at Mirage and several important exploration updates on our grassroot portfolio to be released in the coming weeks, I invite BRW shareholders to follow closely our expected press releases this fall*".
