Cartier Resources Inc. (ECR-V):

Cartier intercepts 29.6 g/t Au over 1.7 m and 13.2 g/t Au over 1.0 m and unlocks new high-grade gold zones in strategic gap between Chimo and East Chimo deposits at Main (Cadillac)

On January 20, 2026, Cartier announced drill results from its 100%-owned Cadillac Project, located in Val-d'Or, Abitibi, Québec. The Cadillac Project is situated ~45 km east of Val-d'Or, Québec and encompasses 14,000 ha along a 15-km stretch of the Cadillac Fault Zone in the Val-d'Or mining camp. It has excellent road access, year-round infrastructure and nearby milling capacity. Recall on December 2, 2025, Cartier had reported drill results from the North Contact Zone ("NCZ") on its Cadillac Project (see end: https://www.linkedin.com/pulse/cartier-resources-inc-ecr-v-cuts-1115-gt-au-over-2-m-confirms-eric-tqcke/) and on January 13, 2026, an update in regards to the 2025 accomplishments and main catalysts for 2026 (see: https://www.linkedin.com/pulse/cartier-resources-inc-ecr-v-metallurgical-testwork-program-lemieux-yzute/?trackingId=7hzXyZwmQxm%2BqvfnBs2RRg%3D%3D).

Brownfield drilling: Drill results from the 100,000-m drilling program are the sixth batch of results from Main Sector on the Cadillac Project. The Main Sector is the central hub of Cartier's Cadillac Project, encompassing multiple mineralized zones, known as West Simon, West Chimo, Chimo, East Chimo, West Nordeau, and VG. This area has long been the focus of exploration, reflected in dense clusters of drill collars and historic infrastructure nearby and several Mineal Resource Estimates and Preliminary Economic Assessments.

Holes CA25-300, 301 and 303 defined 2 high-grade gold zones (5B3 & 5C3), demonstrating robust potential for depth expansion and potential cost reductions with efficient mine planning and development. Salient intercepts are: CA25-300 intersected 29.6 g/t Au over 1.7 m (including 54.3 g/t Au over 0.9 m) (5B3 Zone) at ~150m depth; CA25-303 1m @ 13.2 g/t Au (5C3 Zone) at ~185m depth and CA25-301 intersected 2.7 g/t Au over 5.0 m (including 8.0 g/t Au over 1.0 m (5C3 Zone) at ~235m depth. These new results are strategically located midway between Chimo Deposit and East Chimo Deposit. Recall the Chimo Deposit contains 683,300 oz Au in M&I resources and 904,000 oz Au inferred resources and East Chimo Deposit is host to 1,400 oz Au indicated resources and 464,700 oz Au inferred resources.

Holes CA25-292A, 295, and 296 in the East Chimo Deposit area confirmed the 5B4 Zone. Salient results are: CA25-295 intersected 4.9 g/t Au over 3.1 m at ~75m depth; CA25-292A graded 3.1 g/t Au over 4.0 m at ~50m depth; and CA25-296 intersected 2.3 g/t Au over 8.0 m (5B4 Zone) at ~65m depth. Results suggest mineralization extends to surface, opening the door to more flexible operating scenarios and further potentially improving the project economics. This gold zone is now continuous from surface to 1,300 m and still open at depth, signaling again significant upside potential for resources growth.

We note that 12 drill holes have been disclosed with average intercepts at ~158m vertical depth. We estimate a grade x true thickness metric of 13.98 g/t Au x m for the 7 intercepts of the 6 best holes. Cartier's 2024 and 2025 drilling may have added new high-grade mineralization. Mineralized shoots remain largely open laterally and very much at depth.

Next Steps: Additional drilling is required on the new 5B3/5C3 Zones to expand gold mineralization at depth, which hosts the same style of mineralization than Chimo and East Chimo deposits. Conversely, further exploration drilling is already planned to test several new high-priority regional targets at Main Sector, backed by detailed structural and geological modelling and VRIFY's artificial intelligence (AI) driven targeting. Designated as the Epsilon Target in VRIFY's AI model, this

reinforces the potential for additional gold discoveries and is one of the foundations of Cartier's potential growing resource inventory.

Philippe Cloutier, President and CEO of Cartier commented: "*These new high-grade discoveries between the Chimo and East Chimo deposits demonstrates the continuity of mineralization in this area and reinforces our confidence in the project's growth potential. Confirming near-surface mineralization positions us to advance Cadillac with greater flexibility and improved capital efficiency*".

Ronan Deroff, VP Exploration of Cartier stated: "*These results are very encouraging and mark an important step forward. Drilling has now shifted west of the historical shaft, a largely underexplored area known to host multiple gold occurrences. As we continue to advance the drill program, we see strong potential for resource expansion in the western portion of the Main sector, which could add significantly value to the overall project* ".
