Renforth Resources Inc. (RFR-CSE)

Renforth updates ongoing Parbec Gold Deposit drill program, Abitibi, Québec

On August 5, 2026, Renforth announced an on-going drill program undercutting previously announced surface gold intersections obtained in the stripped area within the open pit footprint of the Parbec Gold Deposit. Recall the 100% owned Parbec property is contiguous to Agnico Eagle's Canadian Malartic Mine property in Québec. Renforth reported to have visually observed in drill core the target lithologies and core samples shall be assayed in due time. Recall on July 30, 2026, Renforth had reported positive channel results from 8 channels, ranging in length between 0.85m to 24.5m, over various lithologies within the recently stripped area of the open pit footprint. The 8 channels were cut in 5 areas with mineralization visually observed and confirmed with exposed felsite horizons, host to 2-6% fine disseminated pyrite, stretching for tens of metres subparallel to the Cadillac-Larder Lake Fault Zone (see: https://www.linkedin.com/posts/eric-lemieux-9468715_quebec-abitibi-parbec-share-7477449458096463873-Y5zy/?utm_source=share&utm_medium=member_desktop&rcm=ACoAAAEEcwYBYv9IQ3WrNxLu2lPkWSB479AjztI). We understand that completed new channels CHNL-PAR-26-59 and CHNL-PAR-26-60, have been completed and sampled.

Parbec Drill Program: A drill set-up has been established to the south of the ~250m x ~100m stripped area locus of interesting lithologies of sediments, diorites and felsites that are gold-bearing lithologies at Parbec. The small drill program is targeting undercuts in the general areas of Channel 51 and Channel 58, which are located proximal to the Cadillac Break at the eastern end of the trenched area and within the potential open pit footprint. The drilling shall permit to investigate below where excessive overburden thickness on the northern side of the stripping area along the Cadillac-Larder Lake Fault Zone.
