Vior Gold Corporation Inc. (VIO-V)

Vior Gold Corporation extends high grade mineralization at depth with 7.94 g/t Au over 4.0 m at Ligneris, Abitibi, Québec

On June 2, 2026, Vior Gold announced new results from its 20,000-m ongoing drill program on its 100%-owned Ligneris Project located 55 km northwest of the town of Amos, Abitibi region, Québec. Drill holes with 7.94 g/t Au over 4 m (at 990.0 m) in Hole LI-26-010-EXT and 11.8 g/t Au over 1.3 m (at 805m) in hole LI-26-028, confirm high-grade vertical continuity while remaining open at depth and laterally. Recall on May 7, 2026, Vior Gold had reported results from 8 holes from its 20,000-m drill program at Ligneris Project (see: https://www.linkedin.com/posts/eric-lemieux-9468715_quebec-abitibi-ligneris-share-7458563867174920192-og7E?utm_source=share&utm_medium=member_desktop&rcm=ACoAAAEEcwYBYv9lQ3WrNxLu2lPkWSB479AjztI). Drillhole LI-26-010-EXT, drilled 50 m SE of drillhole LI-26-005-EXT (previously disclosed with 5.64 g/t Au over 4.0 m), had intersected 5.45 g/t Au over 3.0 m including 14.8 g/t Au over 1.0 m. The interval had confirmed high-grade gold mineralization continuity below 650 m vertically.

Extending mineralization at depth: Mineralization in DDH LI-26-010-EXT that returned 7.94 g/t Au over 4m consists predominantly of trace to 5% pyrite hosted in a strongly silicified rhyolite with a weak to moderate sericitization. Mineralization is characterized by trace to 2% pyrite hosted in a moderately sericitized and silicified rhyolite. The drill hole was collared 50 m SE of LI-26-005-EXT and intersected a second interval that returned 2.99 g/t over 4 m starting at 890 m.
Drillhole LI-26-028 returned 11.8 g/t Au over 1.3 m (including 34.4 g/t Au over 0.4 m), was collared 350 m from drillhole LI-26-007 (21.7 g/t Au over 1m) extending the mineralization and alteration halo further to the SW. Mineralization occurs as finely disseminated pyrite, ranging from 3 to 5% hosted in a moderately to strongly sericitized and silicified rhyolite.

Results from 5 holes are disclosed and we estimate a grade x thickness metric of 13.63 g/t Au x m.

With these results the mineralization structure on South Zone at Ligneris has now been identified over more than 1,100 m laterally.

Next Steps: Vior has completed ~21,000 m of drilling since the beginning of the 2026 program and more than 10,000 assays are pending at the laboratory. Vior is currently drilling with 2 drill rigs and is expected to complete its 30,000 m program by Q4-2026.

Vior is also pleased to announce the beginning of its summer prospecting and mapping programs which will take place from June to September with a team of a ~10 people. The team shall chiefly focus on the recently acquired projects while also covering other generative projects (see: https://www.linkedin.com/pulse/vior-gold-corporation-inc-vio-v-announces-major-abitibi-eric-lemieux-dhkse/?trackingId=LId7%2BkpMQ6Go1bOHzKC1Wg%3D%3D). Conversely, several airborne magnetic and electromagnetic surveys have been completed or are progressing on the recently acquired projects, namely Kinebik, Peacock (Ligneris) and Launay.

Mathieu Savard, President and CEO of Vior Gold Corporation, commented: "*When our drill program began in early January, our primary objective was to test the extension of mineralization at greater depth at Ligneris South Zone. The latest results from drill hole LI-26-010-EXT confirm continuity, grade, and significant thickness down to a depth of 805 meters. Over the coming months, the program will continue to test deeper horizons using step-back drill holes exceeding 1,300 metres. It is well established that Archean gold deposits within the Abitibi Greenstone Belt are deeply rooted, and the South Zone is increasingly demonstrating this characteristic, with encouraging results observed below 800 metres vertically. In light of these results, the current drilling campaign has been expanded to 30,000 metres*".
