Vior Gold Corporation Inc. (VIO-V)

Vior Gold Corporation intersects 12.8 g/t Au over 2.0 m and 5.45 g/t Au over 3.0 m at Ligneris, Abitibi, Québec

On May 7, 2026, Vior Gold announced further drilling results from its 20,000-m drill program on its 100%-owned Ligneris Project located ~55 km NW of Amos, Abitibi region, Québec. Results from 8 holes are disclosed and we estimate a grade x thickness metric of 17.35 g/t Au x m. Recall on March 17, 2026, Vior Gold had announced initial drilling results of 5 holes from its 20,000-m drill program (https://www.linkedin.com/posts/eric-lemieux-9468715_quebec-abitibi-ligneris-share-7439855174480846848-RUjq?utm_source=share&utm_medium=member_desktop&rcm=ACoAAAEEcwYBYv9IQ3WrNxLu2lPkWSB479Ajztl).

Expanding South Zone: Drillhole LI-26-010-EXT, drilled 50 m SE of drillhole LI-26-005-EXT (previously disclosed with 5.64 g/t Au over 4.0 m), intersected 5.45 g/t Au over 3.0 m including 14.8 g/t Au over 1.0 m. This interval confirms high-grade gold mineralization continuity below 650 m vertically. It is hosted in a strongly altered rhyolite characterized primarily by sericite and local patchy to pervasive silica with traces to 2% pyrite. Moreover, drillhole LI-26-010-EXT intersected a broad interval of low-grade gold mineralization that returned 0.79 g/t Au over 40.3 m including 1.19 g/t Au over 15.0 m at 580 m vertical depth.

Drillhole LI-26-012 collared 430 m NE of hole LI-26-002 (previously disclosed with 35.2 g/t Au over 3.0 m) returned values of 12.8 g/t Au over 2.0 m including 22.3 g/t Au over 0.5 m. Mineralization occurs as finely disseminated pyrite, ranging from trace to 5% in strongly silicified bands of centimetric to decametric scale hosted in a strongly sericitized rhyolite.

Drillholes LI-26-014 and LI-26-007 intersected 38.3 g/t Au over 1.0 m and 21.7 g/t Au over 1.0 m respectively. These 2 holes are located on the SW extension of the South Zone mineralized structure. Hole LI-26-007 seems to correlate with the intercept in hole LI-26-006 (previously disclosed with 1.10 g/t Au over 24.2 m). Processing of the whole-rock geochemistry has demonstrated the continuity of the alteration trend towards west, and these new results confirm the fertility of the area.

More to come: Since the commencement of drilling program, Vior has completed ~17,000 meters of drilling on the Ligneris Project. We understand a total of 5,725 assays were received and 9,920 are currently pending at the laboratory. Vior is currently drilling with 2 drill rigs at Ligneris and should complete the first phase of drilling later this spring. Simultaneously, Vior is preparing its first drilling campaign on the recently acquired Kinebik Project, expected to start early this summer (see: https://www.linkedin.com/pulse/vior-gold-corporation-inc-vio-v-announces-major-abitibi-eric-lemieux-dhkse/?trackingId=LId7%2BkpMQ6Go1bOHzKC1Wg%3D%3D).

Mathieu Savard, President and CEO of Vior Gold Corporation, stated: "*With today's results, we demonstrate the continuity of the South Zone mineralized structure which has now been identified over more than 650 meters laterally and 650 meters vertically. Moreover, broader low grade mineralized intervals continue to be intersected which are indicative of a larger gold system. A closer look at the high-grade intercepts previously published on March 17, 2026 have exhibited visible gold in two of the best intervals characterized by the presence of silica and black chlorite usually found in proximity of VMS system. We are very encouraged by these recent results that, in our view, warrant additional drilling to continue assessing that large gold system*".
